

AkuDisp Peristaltic Dispenser

new

The AkuDisp is a peristaltic dispenser designed to work with Forcipol and Kemet lapping machines. It incorporates a stirrer and has programmable timer which is preset with 10 second time intervals and will pump for 2 seconds. A separate purge button will return any solution in the pipework and spray head to the receptacle.

The AkuDisp can be programmed to pump slurries for specific durations and frequencies enabling metered dispensing. This allows a user to accurately control consumable usage.

When integrated onto a Kemet/Metkon machine, the AkuDisp will start and stop with the host machine timer. This means an operator can leave a machine to concentrate on other tasks, safe in the knowledge that the AkuDisp will switch off unattended.

The AkuDisp is easily serviceable, with all rotating parts fitted to the exterior.

Kemet Process Development and Demo Labs

Kemet have a Metallographic centre of excellence in Oxford for training and process development, as well as a Geological sample preparation laboratory at our Maidstone Head Office. Both are available for customer visits and demonstrations.
